## GENERAL DATA

The pilot project SCIENCE AND MATHEMATICS CONTENT IN THE DEVELOPMENT OF DIGITAL COMPETENCES as part of the "Plan for recovery and resilience, the project Reform of higher education for a green and resilient transition to Society 5.0" is being implemented at the Faculty of Natural Sciences and Mathematics, University of Maribor (FNM UM) and at the Faculty for Civil Engineering, Transportation Engineering and Architecture, University of Maribor (FGPA UM), in the period from 01/09/2022 to 31/08/2025. The pilot project compares higher education and university study programs in focusing on mathematics and physics teaching units. The benchmark is focused on contents that include the development of energy literacy, and enable the development of advanced digital competences, such as problem-solving, measurement, modeling, forecasting, simulation, and meaningful use of ICT. Based on the results of the analyses, workshops/courses will be held on those topics that will prove to be insufficiently consolidated, but are necessary for students to improve their *passability*, develop the previously mentioned competences, etc. These contents will also be offered to students in other study programs of the University of Maribor and others, with the possibility of obtaining a micro-certificate.

The pilot project includes researchers and professional colleagues from both participating members of FNM UM and FGPA UM (table 1). At the beginning of the project, a project council was established, which plans and supervises the implementation of the project tasks and ensures that the set time frame is followed in order to achieve all the indicators set in the project application.

The following activities are planned for the pilot project:

- A1) Analysis of the situation;
- A2) Comprehensive planning for the development of competences for the digital and green transition;
- A3) Comprehensive implementation for the development of competences for the digital and green transition and lifelong learning;
- A4) Evaluation.

The status analysis report presents the results of the project for the period from September 1, 2022 to June 20, 2023 (activity A1). The researchers listed in Table 1, employed on the project during this period, participated in the project activities of preparation of methodology and instruments, document analysis and data processing. The report was prepared by members of the project council, asst. prof. Eva Klemenčič, Prof. Robert Repnik, res. asst. Petra Cajnko, Prof. Matej Mencinger, and asst. prof. Borut Macuh and asst. Katja Hanžič.

This report was presented at the first monitoring of the NOO pilot project, carried out by MVZI, on 6/29/2023.

## DESCRIPTION OF THE WORKFLOW BY SUB-ACTIVITIES

Activity A1 State analysis is divided into nine sub-activities, which are listed in Table 2.

Table 2. State analysis sub-activities

| mark | activity  |
|------|---|
| A1   | SITUATION ANALYSIS  |
| A1.1 | Preparation of methodology and instrumentation for situation analysis   |
| A1.2 | Comparative analysis of selected curricula  |
| A1.3 | Analysis of changes in selected curricula   |
| A1.4 | Analysis of the inclusion of digital competences  |
| A1.5 | Analysis of the inclusion of logical, algorithmic and abstract thinking competences (computational competences) |
| A1.6 | Analysis of the inclusion of science competences  |
| A1.7 | Analysis of the involvement of energy literacy and systems thinking   |
| A1.8 | Processing of condition analysis data   |
| A1.9 | Preparation of the report   |

In September 2022, we started work on activity A1 Analysis of the situation. The analysis of the situation is necessary to understand the current state of the teaching units in the selected VS and UN study programs. To achieve the indicator set when the project was registered, i.e. preparation of the status analysis report at the beginning of the pilot project, we divided activity A1 into nine sub-activities , which are written in the table above.

Within the sub-activity *A1.1 Preparation of methodology and instruments for the analysis of the situation* we reviewed the existing research methods for the comparative analysis of curricula and decided on a document analysis and an analysis by key-words. We focused on the curricula of the study programs Civil Engineering UN (FGPA UM), Civil Engineering VS (FGPA UM), Physics UN (FNM UM), Mathematics UN (FNM UM) and Subject teacher (unified master's study program FNM UM) - focus on Educational Physics, Educational Mathematics and Educational Biology. We selected teaching units with related content and/or learning outcomes. For the selected teaching units, we also looked at their time evolution. In order to ensure the objectivity and systematicity of the document analysis, we have prepared a set of instruments, namely a table for entering a comparison of related teaching units and a spreadsheet for entering changes in selected teaching units over time. In February, we updated the table for entering the comparison of related teaching units and added an analysis of the inclusion of digital competences, computational competences, natural science competences and energy literacy.

Sub-activity A1.2 *The comparative analysis of the selected curricula* began in October 2022 and was completed in January 2023. We compared the selected curricula, focusing on differences and similarities in the structure of contact hours, content, goals and competences, expected study results, teaching and learning methods and assessment methods. It turned out that we need to upgrade the methodology, as some differences and similarities are not visible from the document analysis alone. For this purpose, we started preparing a standardized interview (A1.1) in January 2023. Due to the time span of the interviews and the coordination of appointments with the leaders and implementers of the teaching units, the results of the interviews will be presented in the next report, where the results will also be easier to interpret based on the certain required level of development of the selected competences and the content and skills that support the development of these competences.

In February 2023, we started sub-activity A1.3 *Analysis of changes in selected curricula*, where we reviewed major changes in curricula over time from the Bologna reform onwards. We were also interested in the cause of a certain change and the effect of the change.

For the implementation of sub-activities A1.4, A1.5, A1.6 and A1.7 (*Analysis of the involvement of digital competences, computational competences, natural science competences and energy literacy*) we prepared workshops for researchers on the project to unite our understanding of individual competences for the most objective analysis possible. We have prepared a list of key-words and key-terms to search for the inclusion of individual competences. The sub-activity ended in March 2023.

In April and May 2023, we focused on sub-activity A1.8 Data processing and situation analysis and A1.9 Report preparation. The report includes a comparative analysis of the differences and similarities between related teaching units and an analysis of the inclusion of selected competences. The condition analysis report is the starting point for activity A2.

## PREPARATION OF METHODOLOGY AND INSTRUMENTARY FOR SITUATION ANALYSIS

For the analysis of the situation, we chose three established methods: document analysis, keyword analysis and a standardized (semi-structured) interview. For this purpose, we have prepared two tables and questions for a standardized interview.

The document analysis of the curricula within sub-activity A1.2 took place according to the following steps:

1. collection of curricula,
2. selection of teaching units for document analysis;
3. determination of related teaching units according to the similarity of the content in different study programs, focusing on pairs: teaching unit 1, study program Construction VS and teaching unit 2, study program Construction UN, teaching unit 1, study program Physics and teaching unit 2, study program Subject teacher, orientation Educational Physics, Teaching unit 1, study program Mathematics and teaching unit 2, study program Subject teacher, orientation Educational Mathematics;
4. finding differences and similarities of related teaching units in:
  - a) content,
  - b) goals and competences,
  - c) expected study results (knowledge and transferable skills and abilities),
  - d) teaching and learning methods,
  - e) assessment methods;
5. entry into the prepared instrumentation (appendix 1);
6. processing and interpretation.

The instrument is prepared as an Excel spreadsheet, in which the differences between the study units on the selected pairs of study programs are entered (Figure 1).

| AKTUALNA VERZIJA UČNIH ENOT |                                      |                                    |         |                                |                     |                     |                                |                    |   |  |   |

| dokumentna<br>analiza       |                                      |                                    |         |                                |                     |                     |                                |                    |   |  |   |

**Figure 1.** Screenshot of the related teaching unit benchmarking tool.

For sub-activity A1.3, the document analysis was carried out according to the following steps:

1. collection of documents: current curricula and previous versions, spreadsheets with changes to study plans,
2. determination of major changes (changes in the structure of teaching unit hours, changes in content, goals and competences, expected study results, teaching and learning methods and assessment methods) and minor changes in curricula (changes in the basic literature, changes in references of the carrier);
3. setting a time frame;
4. searching for major changes over the years, the cause of the change and the effect of the change;
5. entry into the prepared instrumentation (appendix 3);
6. processing and interpretation.

The instrument is prepared as an Excel spreadsheet, in which temporal changes of the selected teaching units are entered (Figure 2).

**Figure 2.** Screen image of the instrumentation for entering time changes of selected teaching units.

The advantages of document analysis are primarily objectivity and systematicity. However, since in practice the implementation of the pedagogical process may differ slightly from the implementation as foreseen in the curriculum, we decided to prepare a standardized interview (appendix 2).

A standardized (semi-structured) interview is a method that includes open-ended questions and enables consistency and comparability between interviews with different samples. The implementation is still in progress, but we follow the following steps:

1. defining the purpose of the structured interview,
2. preparation of key questions and preparation of open-ended sub-questions for clarification,
3. formulating and classifying the question into a sequence that enables the conversation to flow smoothly,
4. testing the interview to identify potential problems and opportunities for improvement,
5. conducting an interview,
6. transcription and data analysis.

The interview includes questions for sub-activities A1.2, A1.4, A1.5, A1.6 and A1.7. We have divided the questions into five sections, with which we check whether there are differences in the selected

related teaching units in the compared study programs in terms of i) content, ii) intended study results, goals and competences, iii) teaching and learning methods, iv) evaluation methods, and v) basic literature, which are not evident from the document analysis. In each section, we also included questions related to the involvement and development of individual competences in the selected teaching unit. We are also interested in the opinion regarding the possible introduction of differences between study programs (reasons for and against) and in which areas.

For the selected teaching units, we continued with the document analysis by key-words and key-phrases with the aim of finding the inclusion of the selected competences (sub-activities A1.4, A1.5, A1.6 and A1.7). For this purpose, we have also updated the spreadsheet (Figure 3).

| Vključenost digitalnih kompetenc    |    |                     |    |                     |    |                             |    |         |    |                     |    | Vključenost computational thinking (logičnega, algoritmičnega, abstraktnega mišljenja) |    |                             |    |    |    |    |    |    |    |    |    |

## RESULTS

The following is an interpretation of the results of the comparative analysis, separately for teaching units at the Faculty of Natural Sciences and Mathematics and for teaching units at the Faculty of Civil Engineering, Transportation Engineering and Architecture, as well as joint conclusions.

### Comparative analysis of selected teaching units at the Faculty of Natural Sciences and Mathematics

At the Faculty of Natural Sciences and Mathematics, we compared the selected teaching units in the study programs Physics UN, Mathematics UN and Subject Teacher, orientation Educational Physics and Educational Mathematics, recorded in table 4. The results of the document analysis of the selected teaching units are collected in the table "Comparative analysis" (Figure 4): for the study program Physics and Subject Teacher, orientation Educational Physics in Appendix 4, for the study program Mathematics and Subject Teacher, orientation Educational Mathematics in Appendix 5.

Let's first present the results for the non-pedagogical 1st-level study program Physics and the unified master's study program Subject teacher, orientation Educational Physics. With document analysis, **there were no differences** between the curriculum of the course in the non-pedagogical and pedagogical study programs in 4 teaching units. These teaching units are as follows: Computational Physics or Computer in Physics, Measurements in Physics, Applied Physics and Environmental Physics.

In the study units Physics Experiments 2, Physics Experiments 3 and Physics Experiments 4, which are carried out both in the non-pedagogical study program Physics and in the study program Subject Teacher, orientation Educational Physics, there is a difference in the expected study results. In the curricula, among the transferable/key skills of the subject teacher program, the following study result is additionally stated: "*The student learns didactic approaches in dealing with natural phenomena and acquires the ability to transfer knowledge to others*". From the document analysis, however, concrete approaches and methods that would support students in the development of this study result are not evident. We will examine the latter through an interview.

In the teaching units Physics Experiments 1, Physics Experiments 2 and Physics Experiments 3, the content of the laboratory exercises that the students perform also differs to a lesser extent, which is consistent with the differences in the content of the teaching units Mechanics, Electromagnetism and Thermodynamics (fields of the laboratory exercises).

There are major differences in the curricula of the subjects Mechanics, Electromagnetism, Thermodynamics, Modern Physics and Complex Systems. From the document analysis, we can see that the curricula for students of the Physics study program include additional content in the subject Thermodynamics (this is followed by a greater number of hours of lectures and seminar exercises, a total of 20 more contact hours) and Modern Physics. **Additional study results** for students of the Physics study program are listed in the following:

- **Electromagnetism**

*"After successfully completing the teaching unit, students will be able to: use Maxwell's equations to analyze and evaluate electromagnetic phenomena depending on the variables and parameters on which the properties of the system depend; describe the influence of electric charges and electric currents on the structure of the electric and magnetic field; to predict the qualitative properties of the system depending on the symmetry of the constituent parts of the system."*

- **Thermodynamics**

*"After successfully completing the teaching unit, students will be able to use the laws of thermodynamics to analyze a system consisting of several components and to choose the appropriate thermodynamic potential for description."*

- **Oscillation and waves**

*"After successfully completing the teaching unit, students will be able to use modern computers software as an aid in quantitative calculations, for plotting dependencies between variables depending on parameter values, and for forecasting trends."*

- **Modern physics**

*"After successfully completing the teaching unit, students will be able to: use the basic equations of quantum mechanics to demonstrate key quantum phenomena in nature; describe the basic properties of atoms, molecules and crystals; to predict the qualitative properties of the system depending on the constituent parts of the system."*

- **Complex systems**

*"After successfully completing the teaching unit, students will be able to: use simple nonlinear equations to demonstrate key nonlinear examples in nature; describe the basic properties of fractal and chaotic systems; to predict the qualitative properties of the system depending on the symmetry of the constituent parts of the system."*

From the document analysis, concrete approaches and methods that would support students in the development of these study results are not evident, the range of contact hours differs only in the subject Thermodynamics. We will examine the latter through an interview.

From the document analysis, a greater difference is also noticeable in the Mechanics teaching unit. As part of this course, students on the subject teacher, Educational Physics study program also have 15 hours of laboratory exercises, through which they gain an additional understanding of the measurement of basic physics quantities and the processing of the obtained data. Students on the Physics study program acquire this knowledge and skills in more detail in the Basic Measurements course.

The following is a presentation of the results of the document analysis of the inclusion of digital competences, algorithmic, logical and abstract thinking competences, natural science competences and energy literacy by teaching units.

### Applied Physics

*Digital competences:* teaching and learning take place through the didactic use of information and communication technology (ICT).. Involvement in the content and assessment methods is not explicitly stated.

*Competences of algorithmic, logical and abstract thinking:* Identifying, analyzing, and implementing possible solutions with the aim of achieving the most efficient and successful combination of steps and resources: "solving real physics problems in various fields of activity and in applications", which includes identifying, analyzing and implementation of possible solutions with the aim of achieving the most efficient and successful result.

*Natural science competences:* natural science competences are included in the course, students acquire the practical knowledge and experience needed to understand physics phenomena and processes and solve real physics problems, which means the ability to transfer theoretical physics knowledge into successful applications. This develops the ability to analyze and organize information, the ability to interpret, synthesize conclusions and solve problems.

*Energy literacy:* Not explicitly stated. Depending on practical examples, energy literacy can also be developed, which we will examine through interviews.

*Green transition:* The green transition is not explicitly included.

## Mechanics and Oscillations and Waves

*Digital competences:* in the objectives and competences and study results, the ability to use modern computer software as an aid in quantitative calculations and to draw dependencies between variables depending on parameter values is stated. Among the teaching methods is the use of ICT.

*Competences of algorithmic, logical and abstract thinking:* They are developed through problem formulation, logical arrangement and analysis of data, presentation of data with abstractions such as models and simulations; Among the results, it is written to qualitatively and quantitatively predict changes in the state of the system depending on the parameters and variables, to define the physics system and the elements in the surroundings that affect the system.

*Natural science competences:* the teaching unit includes natural science competences to a large extent (ability to gather information, ability to solve problems, use of mathematical ideas and techniques, transfer of knowledge to practice and to various cases).

*Energy literacy:* Not explicitly stated.

*Green transition:* Not explicitly stated.

## Computational physics

*Digital competences:* in the content of the curriculum "with computer tools – plot and combine diagrams, adjustment (fitting) curves, display of errors, extraction, integration, preparation of physics text (equation editors), presentations, storage and transfer of data between different programs, basic measurements with computer, review of computer tools for physics", as well as in terms of goals and competences and study results: "use of basic computer tools in laboratory work and writing physics texts", "The student can use computer tools to process and display the results of measurements, and for professional writing. Working with the computer is particularly important in all laboratory exercises, seminars and the thesis".

*Competences of algorithmic, logical and abstract thinking:* Logical and algorithmic thinking is mainly developed, as students solve problems in a way that enables the use of computers and other tools to solve them.

*Natural science competences:* the transfer of theoretical knowledge into practice, the ability to communicate orally and in writing, the ability to analyze and organize information, and the ability to interpret are developed.

*Energy literacy:* Not explicitly stated.

*Green transition:* Not explicitly stated.

## Thermodynamics

*Digital competences:* Through the use of modern computer software as an aid in quantitative calculations and to draw the dependence between variables depending on the parameter values, the ability to solve problems digitally is developed. Among the teaching methods is the use of ICT.

*Competences of algorithmic, logical and abstract thinking:* mainly from the intended study results: the ability to analyze and distinguish transitions between different states of the system (logical arrangement and analysis of data), the ability to describe a system with the appropriate thermodynamic potential and to analyze a system consisting of several components (presenting data with abstractions such as models and simulations), applying algorithmic thinking and mathematical descriptions to cyclic processes and calculating engine efficiency, generalizing and transferring this problem-solving process to different problems.

*Natural science competences:* the teaching unit includes natural science competences to a large extent (ability to gather information, ability to solve problems, use of mathematical ideas and techniques, transfer of knowledge to practice and to various cases).

*Energy literacy:* Not explicitly stated.

*Green transition:* Not explicitly stated.

## Measurements in Physics

*Digital competences:* They develop through teaching methods, as they use software environments to control and process data.

*Competences of algorithmic, logical and abstract thinking:* present in the objectives, competences and study results: "the establishment and implementation of a measurement system, including a digital measurement scheme, requires the ability to formulate a problem in a way that allows the use of tools, including digital measurement devices", "processing measurement data", "choosing the appropriate measurement method and sensor systems", "evaluating and differentiating the effects of the measurement system and the measured system", "understanding the measurement results and using them to optimize the measurement system" and "deciding whether the selected sensors reasonably fit the defined time frame"; include identifying, analyzing and implementing solutions with the aim of achieving the most effective and successful result.

*Natural science competences:* the teaching unit includes natural science competences to a large extent (ability to gather information, ability to solve problems, use of mathematical ideas and techniques, transfer of knowledge to practice and to various cases).

*Energy literacy:* Not explicitly stated.

*Green transition:* Not explicitly stated.

## Environmental physics

*Digital competences:* explicitly mentioned only for the study results "use of analytical and computer tools":

*Competences of algorithmic, logical and abstract thinking:* primarily present logical data editing and analysis ("ability to interpret measurements and understand physics models"), representation of data with abstractions such as models and simulations ("ability to describe environmental systems, phenomena and processes with physics models"). In addition, it is indicated: "identification and solving physics problems of environmental systems".

*Natural science competences:* the teaching unit includes natural science competences to a large extent (ability to gather information, ability to solve problems, use of mathematical ideas and techniques, transfer of knowledge to practice and to various cases). Students acquire the knowledge necessary for a more complex understanding of physics phenomena and processes in the environment. With various examples from the natural and technical environment, they get to know and understand the meaning and types of energy sources and energy conversions.

*Energy literacy:* The teaching unit includes the learning content "Physics of energy sources", students "get to know and understand the meaning and types of energy sources and energy conversions on various examples from natural and technical environments". Transferable skills are listed as: "student is aware of the importance of environmental protection and is ready to work on physics projects in the field of environmental protection".

*The green transition* is not explicitly included in the teaching unit, but nevertheless it is one of the transferable skills of this teaching unit: "student is aware of the importance of protecting the environment and is ready to work on physics projects in the field of environmental protection". Students gain knowledge about energy conversion and the interaction between different energy sources in the environment, which contributes to the development of renewable sources and the consequent promotion of the green transition.

Document analysis of related study units on the non-pedagogical study program of the 1st level Mathematics and on the unified master's study program Subject teacher, orientation Educational Mathematics showed that **there are no differences in the four study units:** Mathematical modeling, Introduction to differential equations/ Differential equations in context, Theory numbers, Plane and Solid geometry.

In the eight related study units, students not in the non-pedagogical study program learn about additional content that is not intended for consideration in the pedagogical study program. Accordingly, the basic literature and **additional study results** also differ:

- **Number sets and sequences, Analysis 1, Analysis 2**  
"...to use Fourier series for solving problems "
- **Vectors and matrices, Linear algebra**  
"Knowledge of matrix calculus and its application in various fields."
- **Statistics**

*"Transfer of knowledge from statistics to various professional and scientific fields where statistical data analysis is used."*

- **Basics of computing and informatics**

*"Ability to write moderately complex programs"*

With some teaching units, there are not many differences in the content, but in the level of knowledge that the students acquire. In the non-pedagogical study program, students learn about in-depth content (**Analysis 3 and Analysis 4**) and fundamental concepts (**Discrete Mathematics 1, Probability**).

In the subject **Mathematical principles/Introduction to mathematics**, students on the subject teacher study program have the additional content "Mathematical experiments, heuristics, real numbers, plane coordinate system, elementary functions", followed by the additional study results "*ability to use heuristic methods*" and "*ability works with elementary functions*" and the goal "*Learn about creative ways of solving mathematical problems*" and "*Learn about elementary functions*".

The results of the document analysis of changes in the selected teaching units over time are collected in the table "Time development", appendix 6.

## Comparative analysis of selected teaching units at the Faculty of Civil Engineering, Transportation Engineering and Architecture

At the Faculty of Civil Engineering, Transportation Engineering and Architecture, we compared the selected study units in the study programs Construction of the UN and VS.

*Table 5. Selected study units in the study programs of the Faculty of Civil Engineering, Transportation Engineering and Architecture.*

| <i>name of the teaching unit</i>                          | <i>student program</i> |
|---|------------------------|
| Timber structures   | UN Construction        |
| Steel structures  |                        |
| Foundation engineering                                    |                        |
| Concrete structures                                       |                        |
| Building physics  |                        |
| Mathematics A   |                        |
| Mathematics B   |                        |
| Civil engineering materials                               |                        |
| Geometric modeling and descriptive geometry               |                        |
| Physics   |                        |
| Timber structures   | Construction VS        |
| Steel structures  |                        |
| Foundation engineering 1                                  |                        |
| Concrete structures                                       |                        |
| Building physics  |                        |
| Mathematics 1   |                        |

| Introduction to Materials, Materials for Civil Engineers. |                        |
| Geometric modeling and CAD                                |                        |
| Physics   |                        |

The analysis of the curricula for the subject **Steel structures (UN)** and **Steel structures VS** showed that additional content (movable and fixed frames, bending distances) is included in the VS, which is not included in the UN program. As a result, the VS program has one additional resource defined. Compared to the UN program, the VS program has 10 hours less seminar exercises. The analysis did not show any other differences. The description of competences applies to the subject on the UN and VS program. The actual inclusion of the competences listed below will be additionally checked through an interview with the subject holder, as we assume that the subject also covers energy literacy and the green transition, which are not explicitly stated in the curriculum.

*Digital competences:* inclusion is not explicitly stated, we can conclude that they are included, as students learn dimensioning also with the help of computer programs. They also create content using digital technologies (seminar assignment and presentation).

*Competences of algorithmic, logical and abstract thinking:* the course builds on the understanding of the properties of steel structures and builds the ability to dimension steel joints, cross-sections and elements with logical and algorithmic thinking. Included are the basics of data analysis and visualization, information evaluation, design analysis and problem-solving, construction planning, and related information management and organization.

*Natural science competences:* natural science competences are included in the course, as students calculate with physics units (physics quantities that describe weight, strength, tension, pressure, forces and expressions that connect them), learn to analyze information, interpret it and understand the transfer from theory into practice.

*Energy literacy:* elements are not present in the curriculum.

*Green transition:* the elements are not present in the curriculum.

The analysis of the curricula for the subject **Timber constructions (UN)** and **Timber constructions (VS)** showed minor differences between the subjects. The subject of the UN program, unlike the subject at VS, also includes cross-laminated timber and wood products, as well as an understanding of torsion and the combination of torsion and shear. At the same time, the UN subject does not include wooden panels, which are included in the subject of the VS program. There are no differences in the literature, compared to the UN program, there are 5 hours less lectures, 10 hours less seminar exercises and 15 hours less individual student work. The description of competences applies to the subject on the UN and VS program. The actual inclusion of the competences listed below will be additionally checked through an interview with the subject holder, as we assume that the subject also covers energy literacy and the green transition, which are not explicitly stated in the curriculum.

*Digital competences:* inclusion is not explicitly stated, we can conclude that they are included, as students learn dimensioning also with the help of computer programs.

*Competences of algorithmic, logical and abstract thinking:* the course includes the basics of data analysis and visualization, information evaluation, analysis and solving problems in construction, construction planning and related management and organization of information. After completing the course, students are able to perform independent static analysis and dimensioning of wooden structures.

*Natural science competences:* natural science competences are included in the course, as students calculate with physics units (physics quantities that describe weight, strength, tension, pressure, forces and expressions that connect them), learn to analyze information, interpret it and understand the transfer from theory into practice.

*Energy literacy:* elements are not present in the curriculum.

*Green transition:* the elements are not present in the curriculum.

From the document analysis for the teaching units **Foundation engineering 1 (VS)** and **Foundation engineering (UN)**, it can be concluded that digital competences are explicitly included in both the VS and the UN program. Namely, as the implementation and study of geomechanical analyzes with standard software tools in geotechnics Larix and Plaxis. Furthermore, the use of tabular calculations - smaller applications - in MS Excel is known. When preparing and presenting seminar assignments, students use a text editor (e.g., MS Word) and a presentation program (MS Power Point). Perhaps even more information can be obtained in an interview with the subject holders. Perhaps some other non-commercial program is used in the exercises to calculate individual problems from geotechnics, it is probably present within professional procedures.

The involvement of logical, algorithmic and abstract thinking in the content can be detected on the basis of document analysis in the transfer of influences to the earth's half-space, knowledge of the interaction object - foundation - soil, understanding of procedures and analytical and numerical models for proving limit states of bearing capacity and usability of all types of geotechnical objects from geotechnical practices.

Natural science competences: calculation with physics units (physics quantities that describe humidity, volumetric weight, permeability, tension, and expressions that connect them), collection and analysis of information/interpretation/transfer from theory to practice/concern for the design of reliable and safe considered geotechnical constructions. All these competences are included in the following learning outcomes: "use standard procedures of geological-geomechanical research, use standard procedures of geotechnical measurements, use standard procedures of monitoring, compare several types of technologies for performing work in geotechnical practice, study geomechanical analyzes with standard Larix software tools and Plaxis". The latter is mainly related to concern for quality and transfer from theory to practice. Also included are the competences of information gathering and analysis and interpretation.

Energy literacy is not explicitly included in either the VS or the UN program. Geotechnical structures must be designed in a way that takes into account the energy efficiency of buildings, the control and reduction of moisture and sometimes noise. From the document analysis, it is not possible to discern differences in competences between the VS and UN programs. More precisely, we will try to obtain these differences through an interview.

The green transition is not explicitly included in either the VS or the UN program. As in the case of energy literacy, the contents that indirectly affect the green transition are listed here. Geotechnical structures must be designed in such a way that they take into account the energy efficiency of buildings, which directly affects sustainable development and an efficient green transition. The connection between the energy efficiency of buildings and the green transition represents an

important part of energy consumption and has great potential to reduce negative environmental impacts.

From the document analysis of teaching units **Concrete Construction VS** and **Concrete Construction UN**, it can be concluded that digital competences are explicitly included in both the VS and the UN program. Namely, as the use of a computer program for the analysis and dimensioning of concrete structures. When preparing and presenting seminar assignments, students use a text editor (e.g., MS Word) and a presentation program (MS Power Point). Perhaps even more information can be obtained in an interview with the subject holder. Perhaps some other non-commercial program is used in the exercises to calculate individual problems from concrete structures, this is probably present within professional procedures.

The involvement of logical, algorithmic and abstract thinking in the content can be detected on the basis of document analysis in the understanding and use of the design of individual reinforced concrete structural elements (beam, slab, column) in accordance with Eurocode 1992 regulations.

Natural science competences: calculation with physics units (physics quantities that describe volumetric weight, stress, deformations and terms that connect them), collection and analysis of information/interpretation/transfer from theory to practice/care for the design of reliable and safe concrete structures in question. All these competences are included in the following learning outcomes "possibility of analysis, dimensioning and implementation of individual reinforced concrete structural elements". The latter is mainly related to concern for quality and transfer from theory to practice. Also included are the competences of information gathering and analysis and interpretation.

Energy literacy is not explicitly included in either the VS or the UN program. Concrete structures must be designed in a way that takes into account the energy efficiency of buildings, the control and reduction of moisture and noise. From the document analysis, it is not possible to discern differences in competences between the VS and UN programs. More precisely, we will try to obtain these differences through an interview.

The green transition is not explicitly included in either the VS or the UN program. As in the case of energy literacy, the contents that indirectly affect the green transition are listed here. Concrete structures must be designed in such a way that they take into account the energy efficiency of buildings, which directly affects sustainable development and an effective green transition. The connection between the energy efficiency of buildings and the green transition represents an important part of energy consumption and has great potential to reduce negative environmental impacts.

From the document analysis for the subject **Building Physics (UN)** and **Building Physics (VS)**, it can be concluded that digital competences are not explicitly included in either the CS or the UN program. Perhaps more information can be obtained in an interview with the subject holder. Perhaps some non-commercial program for calculating heat losses is used in the exercises: this is probably present within the professional procedures (this is mentioned in the competences). Based on document analysis, the involvement of logical, algorithmic and abstract thinking in the content can be detected in the transmission of heat, sound and light. Especially in heat transfer in building elements. The competences also focus on the transfer of heat and moisture.

Natural science competences: calculation with physics units (physics quantities that describe heat, moisture, sound and light and the expressions that connect them), gathering and analyzing

information/interpretation/transfer from theory to practice/concern for quality and safety: all these competences are included in the following learning outcomes: "qualitatively predict and quantitatively determine heat losses, the amount of moisture, sound and light in simple cases, choose professionally suitable construction solutions regarding heat transfer, the amount of moisture, and the amount and quality of sound and light, identify the causes of excessive heat loss, amount of moisture, and inappropriate amount and quality of sound and light, and devise remedial measures". The latter is mainly related to concern for quality and transfer from theory to practice. Also included are the competences of information gathering and analysis and interpretation.

Energy literacy in the Building Physics subject (for the UN and VS program) is explicitly written in the goals and competences: "to learn about professional procedures for improving the energy efficiency of buildings, acoustics and lighting, as well as for controlling and reducing moisture and noise". This is also explicitly stated in the learning outcomes/study results, which are already mentioned in the previous paragraph. From the document analysis, it is not possible to discern differences in competences between the VS and UN programs. More precisely, we will try to obtain these differences through an interview.

The green transition is not explicitly included in either the VS or the UN program. Nevertheless, the description of the object mentions the energy efficiency of buildings, acoustics and lighting, the reduction of humidity and noise, which indirectly leads to lower and at the same time more efficient energy consumption. Comparison of **mathematics subjects (Mathematics A, Mathematics B (UN) and Mathematics 1, Mathematics 2 (VS))**: Digital competences: for the subjects Mathematics A and Mathematics B at the UN, after reviewing the documentation, we conclude that digital competences are not explicitly included. More information can be obtained in an interview with the subject holder. Mathematical programs can be used during the exercises, with which students can check the results, find out how the results are affected by changing the data in the tasks, use the online classroom

The SWP-SNB package is used to solve more difficult application problems in the subject Mathematics 1 on the VS program. The student is expected to understand the basic mathematical ideas and computational power of this package. In the subject Mathematics 2 on the VS program, with the help of the Scientific software NoteBook solves systems of equations, calculates integrals, the program is also used for the basics of statistics.

Logical, algorithmic, abstract thinking: students can express and write down their mathematical assumptions, questions and solutions. They know how to think about a problem, write down the process of thinking and design and analyze a solution. In doing so, they develop the ability to interpret and synthesize conclusions. They learn to recognize the possibilities of using mathematical methods in problems encountered in the natural sciences, technology and social sciences. The personal competences involved in this are curiosity, motivation, creativity, perseverance.

Natural science competences: students can explain basic concepts from analysis and algebra. They know how to present a problem, gather information and find a solution (independently or through a group discussion, thereby developing mutual interaction). At the same time, they learn to research and think critically. They acquire the basic skills of mathematical modeling and solving some engineering problems. In the VS program, the student understands basic mathematical ideas, also with

the help of programs for symbolic computation, so that he can follow the theoretical derivations in professional subjects.

Energy literacy: explicitly not included.

Green transition: elements are not present.

Comparison of the courses **Civil engineering materials (UN)** and **Introduction to materials in construction engineering, materials in construction engineering (VS)**: Digital competences: from the document analysis, it can be concluded that digital competences are not explicitly included neither in the VS nor in the UN program. We can conclude, however, that students use online classrooms, the Internet, ... Students learn about methods for characterizing and testing materials, which is why computer programs are probably also used in laboratory and seminar exercises, as we learn more from the conversation with the course instructors.

Logical, algorithmic, abstract thinking: students understand the connection between the microscopic structure of materials and their macroscopic properties, understand the principles of testing and designing materials for engineering applications. They train the ability to solve problems in connection with qualitative and quantitative information - they focus on important information, neglecting unimportant information.

Natural science competences: students develop specific chemical competences: the ability to use chemical knowledge and understanding in solving problems, the ability to demonstrate knowledge and understanding of essential chemical theories, and the ability to interpret data obtained on the basis of laboratory observations and measurements. The structure of materials is considered at different dimensional levels with the aim of being able to distinguish the main groups of materials and calculate basic chemical, physics and mechanical parameters.

Energy literacy: from the document analysis, we conclude that energy literacy is not explicitly discussed. However, since students are taught about the main materials used in construction, it is likely that they strive to be as natural, durable and energy efficient as possible. The student must be able to choose the optimal materials according to the conditions of use, probably also from the point of view of energy literacy.

Green transition: also in this case, elements of the green transition are indirectly included in the teaching unit. Students are taught about different building materials and their properties (energy efficiency, recyclability, sustainability, self-sufficiency), which are an important aspect of the green transition.

Comparison of courses **Geometric modeling and descriptive geometry (UN)** and **Geometric modeling and CAD (VS)**: Digital competences: students use CAD tools. Namely, they have computer exercises, where all learned technologies, methods and procedures are practically used with the selected CAD tool. In addition to CAD technology, they probably use other digital technologies, for example to prepare and present seminar assignments, they use online classrooms to submit assignments...

Computational thinking (logical, algorithmic, abstract thinking): students are able to solve selected geometric construction tasks, using and understanding engineering projections. They master the basics of modeling 3D objects, know how to create them, visualize and display them spatially.

Natural science competences: students know how to use mathematical tools for selected construction tasks: tangent, ellipse, ... They know how to calculate and draw perspective and oblique parallel projections. They approach the modeling of 3D objects analytically: with the method of polygonal grids and the method of parametric boundary surfaces. They learn to recognize the possibilities of using mathematical methods in curve modeling.

Energy literacy is not explicitly included in any subject (for the UN and VS program).

Green transition: elements are not present.

From the document analysis for the subject **Building Physics**, it can be concluded that digital competences are not explicitly included in either the VS or the UN program. Perhaps more information can be obtained in an interview with the subject holder. Perhaps some non-commercial program for calculating heat losses is used in the exercises: this is probably present within the professional procedures (this is mentioned in the competences). Based on document analysis, the involvement of logical, algorithmic and abstract thinking in the content can be detected in the transmission of heat, sound and light. Especially in heat transfer in building elements. The competences also focus on the transfer of heat and moisture.

Natural science competences: calculation with physics units (physics quantities that describe heat, moisture, sound and light, and the terms that connect them), collection and analysis of information/interpretation/transfer from theory to practice/concern for quality and safety: all these competences are included in the following learning outcomes: "qualitatively predict and quantitatively determine heat losses, the amount of moisture, sound and light in simple cases, choose professionally suitable construction solutions regarding heat transfer, the amount of moisture, and the amount and quality of sound and light, identify the causes of excessive heat loss, amount of moisture, and inappropriate amount and quality of sound and light, and devise remedial measures". The latter is mainly related to concern for quality and transfer from theory to practice. Also included are the competences of information gathering and analysis and interpretation.

Energy literacy in the Building Physics subject (for the UN and VS program) is explicitly written in the goals and competences: "to learn about professional procedures for improving the energy efficiency of buildings, acoustics and lighting, as well as for controlling and reducing moisture and noise". This is also explicitly stated in the learning outcomes/study results, which are already mentioned in the previous paragraph. From the document analysis, it is not possible to discern differences in competences between the VS and UN programs. More precisely, we will try to obtain these differences through an interview.

The green transition is not explicitly included in either the VS or the UN program. Nevertheless, the description of the teaching unit mentions the energy efficiency of buildings, acoustics and lighting, the reduction of humidity and noise, which indirectly leads to lower and at the same time more efficient energy consumption.

The results of the document analysis of changes in the selected teaching units over time are collected in the table "Time development", appendix 8.

## POTENTIAL PROBLEMS

During the implementation of activity A1, we encountered some minor issues that we were able to fix promptly. Initially, we planned to assess the situation through document analysis, but during the implementation, we realized that we wouldn't be able to gather all the information we needed this way. It is also possible that the document analysis might not always show the real state of implementation. For this reason, we opted to conduct standardized (semi-structured) interviews. However, conducting interviews with leaders and implementers of teaching units has delayed the analysis of the situation as it is a time-consuming process. The interview is already partially intertwined with the contents of activity A2. Nonetheless, interviews enable us to gather the opinions of professors on the integration of selected competences into the pedagogical process., which contributes to the formation of the required level of development of the graduate's competences. At the same time, interviews gather information about the content and the teaching methods, which helps us prepare a set of content and skills to support the development of selected competences. All sub-activities were carried out smoothly, without major problems.

## CONCLUSIONS

The following report analyzes the situation by comparing various teaching units and examining the inclusion of selected competencies. The study compared related teaching units based on their content, expected learning outcomes, goals and competencies, teaching and learning methods, assessment methods, and basic literature. The analysis focused on the involvement of digital competencies, algorithmic, logical, and abstract thinking competencies, natural science competencies, and energy literacy.

The majority of teaching units in the study programs Physics, Subject Teacher - Educational Physics, Construction VS, and Construction UN were found to include content and methods that promote the development of natural science competences, which is expected given the field of the studied study programs. However, algorithmic, logical and abstract thinking competencies are mentioned explicitly in only a few study units, particularly in the study programs Mathematics and Subject Teacher - Educational Mathematics.

Teaching units in general also include skills that support the development of digital competences, which are explicitly written mainly in teaching and learning methods (such as the use of ICT and simulation environments). However, fewer digital competences are recorded in the content of the teaching units, which could be improved.

The study found that energy literacy is included to the smallest extent, explicitly mentioned only in two study units, namely Environmental Physics (study program Physics and Subject Teacher - Educational Physics) and Building Physics (study program Construction VS/UN). A similar conclusion was reached in the case of the green transition, where green content is directly included only in the study unit Environmental Physics (study program Physics and Subject Teacher - Educational Physics).

## APPENDICES

- APPENDIX 1 - INSTRUMENTARY: Documentary analysis of the comparison of teaching units
- APPENDIX 2 – INSTRUMENTARY: Interview
- APPENDIX 3 - INSTRUMENTARY: Documentary analysis of changes over time in teaching units
- APPENDIX 4 - COMPARISON OF TEACHING UNITS: study program PHYSICS and SUBJECT TEACHER - EDUCATIONAL PHYSICS
- APPENDIX 5 - COMPARISON OF TEACHING UNITS: study program MATHEMATICS and SUBJECT TEACHER - EDUCATIONAL MATHEMATICS
- APPENDIX 6 - TIME DEVELOPMENT: study program Mathematics, Physics and Subject Teacher, orientations Educational Mathematics and Educational Physics
- APPENDIX 7 - COMPARISON OF TEACHING UNITS: Study program Civil Engineering VS and Civil Engineering UN
- APPENDIX 8 – TIME DEVELOPMENT: study program Civil Engineering VS and Civil Engineering UN

## APPENDIX 2 – INSTRUMENTARY: Interview

All questions refer to lectures or exercises that you carry out in related study units on the study program \_\_\_\_\_ and \_\_\_\_\_

Name of the study unit on the \_\_\_\_\_ study program:

Name of the study unit on the \_\_\_\_\_ study program:

### I. The next set of questions is related to the CONTENT of the studied units.

1. Do you make differences when presenting the same/similar content on both programs?
  - a. If so, which ones?
  - b. If not, do you think it would be easier for students to absorb the material if we introduced differences in the delivery of the content? If so, which ones?
2. Do you include content from the field of **digital competences in the pedagogical process of the course?**<sup>1</sup>
  - a. If so, which ones? (and what are the differences between the two programs, if any?)
  - b. no
3. Do you include content from the field of **logical, algorithmic and abstract thinking in the pedagogical process of the course ?**
  - a. If so, in what way? (and what are the differences between the two programs, if any?)
  - b. no
4. Do you include content from the field of **natural science competences in the pedagogical process of the course ?**
  - a. If so, which ones? (and what are the differences between the two programs, if any?)
  - b. no
5. Do you include content from the field of **energy literacy in the pedagogical process of the course ?**
  - a. If so, in what way? (and what are the differences between the two programs, if any?)
  - b. no

### II. The next question is related to the BASIC LITERATURE AND RESOURCES for the studied units.

- a. Do you recommend different core readings and resources on the two programs?
  - i. If so, which ones?
  - ii. If not, do you think it would be easier for students to absorb the material if we introduced differences in the background literature and sources? If so, which ones?

### III. The next set of questions is related to the OBJECTIVES AND COMPETENCES of the studied units.

#### III.1 Are the goals and competences different in the two programs?

- a. If so, what are the differences?

- b. If not, do you think students would benefit from customized goals and competences? If so, how?

**III.2 Are digital competences also included among the goals and competences ?<sup>2</sup>**

- a. If so, which ones? (and what are the differences between the two programs, if any?)  
b. no

**III.3 Is the use of logical, algorithmic and abstract thinking among the goals and competences ?**

- a. If so, in what way? (and what are the differences between the two programs, if any?)  
b. No

**III.4 Do the goals and competences also include natural science competences ?**

- a. If so, which ones? (and what are the differences between the two programs, if any?)  
b. no

**III.5 Is energy literacy included among the goals and competences ?**

- a. If so, in what way? (and what are the differences between the two programs, if any?)  
b. no

**IV. The next set of questions is related to the STUDY RESULTS of the studied units.**

1. Are the intended study results different for the two programs?
  - a. If so, what are the differences?
  - b. If not, do you think students would benefit from adjusted predicted learning outcomes? If so, how?
2. Is the development of **digital competences foreseen among the study results**?<sup>3</sup>
  - a. If so, in what way? (and what are the differences between the two programs, if any?)
  - b. no
3. Is the development of **logical, algorithmic and abstract thinking expected among the study results**?
  - a. If so, in what way? (and what are the differences between the two programs, if any?)
  - b. no
4. Is the development of **natural science competences foreseen among the study results**?
  - a. If so, in what way? (and what are the differences between the two programs, if any?)
  - b. no
5. Is the development of **energy literacy foreseen among the study results**?
  - a. If so, in what way? (and what are the differences between the two programs, if any?)
  - b. no

**Q. The next set of questions is related to TEACHING AND LEARNING METHODS.**

1. Do you make differences in the methods of teaching and learning when giving material or individual work on both programs?
  - a. If so, which ones?
  - b. If not, do you think that it would be easier for students to learn the material if differences in teaching and learning methods were introduced in the delivery of the material or individual work? If so, which ones?
2. Do teaching and learning methods foresee the use of **digital competences** ?<sup>4</sup>
  - a. If so, which ones? (and what are the differences between the two programs, if any?)
  - b. No
3. Do teaching and learning methods foresee the use of **logical, algorithmic and abstract thinking** ?
  - a. If so, in what way? (and what are the differences between the two programs, if any?)
  - b. no
4. Do the teaching and learning methods foresee the use of **science competences** ?
  - a. If so, which ones? (and what are the differences between the two programs, if any?)
  - b. No
5. Do teaching and learning methods foresee the use of **energy literacy** ?
  - a. If so, in what way? (and what are the differences between the two programs, if any?)
  - b. no

**VI. The next set of questions is related to ASSESSMENT METHODS for the studied units.**

1. Do you make any differences in the way of assessment in the two programs?
  - a. If so, which ones?
  - b. If not, do you think it would be appropriate to introduce differences?

| FSPA | UN Gradbenstvo  | 1. | 2022/23 | Matematika B | Dodatano linearna neodvisnost vektorjev in baza prostora, uporaba geometrijskih založništv. Ljubljana, 2008. | Dodatano: Predavanja, razlage, diskusija, vaje, obrčana uporaba računalniških orodij.  | pisni izpit 70%, ustni izpit 30%.   | Ni pogojev za vključitev v delo.<br>Pogoj za osnivanje študijskih obveznosti:<br>Pogoj za pristop k ustremu Izbiču je opravljen pisan izpit z vsaj 50% in opravljena individualna domača   |
| FSPA | UIm Gradbenstvo | 1. | 2023/24 | Matematika B | DODATNO IN TROJNI INTEGRALI  | Osnovna/basic - M. Mencinger: Zbirka nalog iz matematične analize in algebri, FG, Maribor 2006 - R. Jammik: MATEMATIKA, DMFA, Ljubljana, 2008.   | Pri tem predmetu naj se pridobi in izrediti znanj ter vredne s področja matematike ki je potrebno da opravi obveznosti pri drugih izpitih, ki jih mora opraviti v svojem študiju.   | Znanje in razumevanje: razumevanje: studentom in študentkam bomo podali naslednje matematične vežbine in znanje: reševanje NDR preverjanja in NDR drugega dela s konstantnimi koeficienti.   |
| FSPA | Vs Gradbenstvo  | 1. | 2013/14 | Matematika 2 | DODATNO IN TROJNI INTEGRALI  | Osnovna/basic - M. Mencinger: Zbirka nalog iz matematične analize in algebri, FG, Maribor 2006 - M.R. Spiegel & J.L. Stephens: Schaum's outlines STATISTICS, McGraw-Hill, New York 2008. | Pri tem predmetu naj se pridobi in izrediti znanj ter vredne s področja matematike ki je potrebno da opravi obveznosti pri drugih izpitih, ki jih mora opraviti v svojem študiju.   | Znanje in razumevanje: student(t)a bo razširila razumevanje na drugačia(na) znanje, ki ga je pridobila(a) pri predmetu Matematika I.   |
| FSPA | Vs Gradbenstvo  | 1. | 2014/15 | Matematika 2 | DIFERENCIJALNE VZRAJNOSTI  | - S. Gabrovic: Uporabna programa Scientific Notebook, FS, Maribor 2000. - M.R. Spiegel & J.L. Stephens: Schaum's outlines STATISTICS, McGraw-Hill, New York 2008.                        | Trojni integral: definicija in enostavne lastnosti, metode za računanje (določenini integral, uporaba integrala doblega integrala), uporaba trojneg integrala (računanje prostornin, statičnih in vzrajanosti momentov tel), DIFERENCIJALNE VZRAJNOSTI: Diferencialna enačba: Diferencialna enačba: Spremenljivo leto Izdaje: | Razumevanje pomena parcialnih odvodov; tako da boljško doberi Taylorjev pritlikz funkcije vec spremeni(j) in da bo lahko poskal ekstreme funkcije obeh spremenljivk. Zna bodi računati dvojne integrale s ponocjo okratnih integralov. Znali bodo izračunati ploščine in momente kov. Znali bodo računati trojne |
| FSPA | Vs Gradbenstvo  | 1. | 2014/15 | Matematika 2 |  |  |   |  |
| FSPA | Vs Gradbenstvo  | 1. | 2015/16 | Matematika 2 |  |  |   |  |
| FSPA | Vs Gradbenstvo  | 1. | 2016/17 | Matematika 2 |  |  |   |  |
| FSPA | Vs Gradbenstvo  | 1. | 2017/18 | Matematika 2 |  |  |   |  |
| FSPA | Vs Gradbenstvo  | 1. | 2018/19 | Matematika 2 |  |  |   |  |
| FSPA | Vs Gradbenstvo  | 1. | 2019/20 | Matematika 2 |  |  |   |  |
| FSPA | Vs Gradbenstvo  | 1. | 2020/21 | Matematika 2 |  |  |   |  |
| FSPA | Vs Gradbenstvo  | 1. | 2021/22 | Matematika 2 |  |  |   |  |
| FSPA | Vs Gradbenstvo  | 1. | 2022/23 | Matematika 2 |  |  |   |  |
| FSPA | Vs Gradbenstvo  | 1. | 2023/24 | Matematika 2 |  |  |   |  |

| FGPA | UN Gradbenštvo | 1. | 2006/07 | Inženirski materiali                | 14) Učivo večinoma angleščinsko vključno z gradbeniškim priročnikom 2004 | Študenti bodo spoznali ostre znanosti o materialih, se seznanili s povezavami med mikroskopsko strukturo materialov in njeno povezavo z lastnostmi materialov ter njihovo obnašanje pri različnih pogojih. Strukturo materialov bodo obravnavali na različnih dimenzijah in nivojih: na atomskem in zlinarjev, 11. Keramike, 12. Polimera, 13. Kompoziti, 14. Beton, 15. Grabnina keramika, 16. Asfalt, 17. Les, 18. Izolacijski in zaščitni materiali. | Znanje in razumevanje: Seminarističke vaje 3. Laboratorijske vaje, ki bodo potekale z uporabo sestavljenih in kasnejših metod in opreme | Kolektivji (30%)/pisci izpit (30%), ustni izpit (40%) | Obvezne tablje in pisni izpit | Opravljen izpit iz Matematike A, Fizike in Geologije |  |
