

Univerza v Mariboru

Fakulteta za naravoslovje
in matematiko

UČNI NAČRT PREDMETA / SUBJECT SPECIFICATION

Predmet:	Uvod v kvantno mehaniko
Subject Title:	Introduction to Quantum Mechanics

Študijski program Study programme	Študijska smer Study field	Letnik Year	Semester Semester
Fizika, 1. stopnja		3	5
Physics, 1st cycle		3	5

Vrsta predmeta / Course type	Izbirni / elective
------------------------------	--------------------

Univerzitetna koda predmeta / University subject code:	
--	--

Predavanja Lectures	Seminar Seminar	Sem. vaje Tutorial	Lab. vaje Labor work	Teren. vaje Field work	Samost. delo Individ. work	ECTS
40		20			120	6

Nosilec predmeta / Lecturer:	prof. dr. Jana Padežnik Gomilšek
------------------------------	----------------------------------

Jeziki / Languages:	Predavanja / Lectures: slovensko/Slovenian
	Vaje / Tutorial: slovensko/Slovenian

Pogoji za vključitev v delo oz. za opravljanje
študijskih obveznosti:

Predznanje iz moderne fizike in osnov algebре.	Pre-knowledge of the Modern Physics and basic Algebra.
--	---

Vsebina:	Content (Syllabus outline):
----------	-----------------------------

Temeljni literatura in viri / Textbooks:

1. N. Zettili, Quantum Mechanics – Concepts and Applications (Wiley, Chichester, 2005).
2. M. C. Rogalski, S. B. Palmer, Quantum Physics (Gordon and Breach, Amsterdam, 1999).
3. D. J. Griffiths, Introduction to Quantum Mechanics (Prentice Hall, Upper Saddle River, 1994).
4. Y. Peleg, R. Pnini, E. Zaarur, Schaum's outlines – Quantum Mechanics (McGraw Hill, New York, 1998).
5. A. Ramšak, Kvantna mehanika (Založba Univerze v Ljubljani, Ljubljana, 2021).

Cilji:

Študenti usvojijo temeljna matematična orodja kvantne mehanike, znajo opredeliti postulate, simetrije in ohranitvene zakone ter jih uporabiti za obravnavo nekaterih osnovnih ravnovesnih kvantomehanskih sistemov.

Objectives:

Students obtain basic mathematical principles of Quantum Mechanics, are able to define postulates, symmetries and conservation laws and use them to tackle some basic equilibrium quantum-mechanical systems.

Predvideni študijski rezultati:

Znanje in razumevanje:

Po uspešno zaključeni učni enoti bodo študenti zmožni:

- definirati kvantni sistem ter uporabiti matematične metode za njegov opis;

Intended learning outcomes:

Knowledge and Understanding:

On completion of this course students will be able to:

- uporabiti napredna matematična orodja za izračun pričakovanih vrednosti različnih opazljivk v kvantomehanskem sistemu;
- napovedati časovni razvoj sistema za sisteme, kjer se energija s časom ne spreminja;
- izračunati energijska stanja v nekaterih analitično rešljivih enodimenzionalnih sistemih in za vodikov atom z reševanjem Schrödingerjeve enačbe in z matrično formulacijo;
- obravnavati lastna stanja tirne, spinske in polne vrtilne količine ter prehode med stanji z različno projekcijo vrtilne količine.

Prenesljive/ključne spremnosti in drugi atributi:
Po uspešno zaključeni učni enoti bodo študenti zmožni:

- uporabljati diferencialne enačbe drugega reda;
- osnove nekomutativne algebre uporabiti za reševanje fizikalnih problemov;
- uporabljati unitarno in Fourierovo transformacijo;
- v optiki uporabiti matematično analogijo pri obravnavi tanke plasti (potencialna plast v KM), odboj in lom (potencialni skok) itd...
- brati strokovne tekste s področja moderne fizike (Diracova notacija, Hilbertov prostor, operatorji, pričakovane vrednosti...) ;

- define a quantum system and use mathematical methods for its description;
- use advanced mathematical tools to find expectation values of different observables in a quantum-mechanical system;
- predict the time development of systems in which energy does not change with time;
- calculate energy levels in some analytically solvable one-dimensional systems and for a hydrogen atom by using the Schrödinger equation and matrix formulation;
- find the eigen states of the orbit, spin and total angular momentum and discuss transitions between states with different projection of angular momentum.

Transferable/Key Skills and other attributes:
On completion of this course students will be able to:

- use second order differential equations;
- apply methods of noncommutative algebra to solve physical problems;
- use unitary and Fourier transformations;
- use mathematical analogies in optics to study thin films (potential barrier in QM), reflection and refraction (potential jump), etc.
- read scientific literature in the field of modern physics (Dirac notation, Hilbert space, operators, expected values...)

Metode poučevanja in učenja:

predavanja
teoretične vaje
razlaga
razgovor
demonstracija

Learning and teaching methods:

lectures
theoretical excercises
explanation
discussion
demonstration

delo s tekstom metoda pisnih in grafičnih del uporaba simulacij uporaba simulacijskih okolij	work with text work with graphic elements use of simulations use of simulation software
---	--

Načini ocenjevanja:	Delež (v %) / Weight (in %)	Assessment:
pisni izpit (lahko se nadomesti s 4 pisnimi kolokviji)	50%	Written exam (can be replaced by 4 written tests)
ustni izpit (zagovor teoretičnih nalog)	50%	Oral exam (defence of theoretical exercises)
Za uspešno zaključeno učno enoto mora vsak del posebej biti pozitiven; vse teoretične naloge morajo biti izračunane in zagovorjene.		For a successful completion, both written and oral exams must be positive; all theoretical problems must be solved and defended.
